Posted byAnonymouson 4/2/2017 Great for temporary text files When people create temporary text files, for example on Notes, you don't want them to easily be opened by anyone. An option to encrypt the content might be just what you need to create files that are shared with a limited number of people. Gulosh lets you do just that, with a user interface that's easy to use and a powerful encryption algorithm. It's perfect for temporary files that you share with those you work with. You can encrypt individual files, folders, and volumes. All content is password protected, plus you can create your own custom encryption key. It's stored in a configuration file, which is created automatically the first time you use the program. You can use the available buttons to set the keys manually, but you can also set automatic encryption settings. This means you can create a master key, which is only usable the first time you use the application, then a daily or a weekly key. The target application is Windows, meaning you can open files and work with them under the user interface. While the method is very simple, it allows you to work securely with text files. Set default settings for encryption You

## What's New In?

Gulosh is a cross platform security app for encrypting, sharing and locking files using strong encryption. To start using it, open and run Gulosh.exe. You will be greeted with a Start Page, where you can add and edit the various user settings. Gulosh is a free app, and can work on multiple platforms, including Windows, Mac and Linux. Make sure that you install Java Runtime Environment (JRE) before installing the app. Gulosh's settings can be managed using settings page. Gulosh provides the following security features: Gulosh allow multiple account users to access the app, be it multiple windows or browser windows. Gulosh can be shared with the public. The public can send the shared files for encryption without any subscription. The public can decrypt the shared files by sending proper decryption keys to the app. You can also specify the encryption level with Gulosh. When the level is specified to the Public, it generates public keys for the files with which the public can decrypt the shared files. If the encrypted files have strong encryption key, it gives the best performance. However, for weak encryption key, it will be a little slow. The performance for the decryption depends upon the amount of decryption keys, shared encryption keys, share levels and the password that is used to set the encryption keys. It will take couple of minutes to get the decryption keys and share the files for public. Decryption keys are generated based on the file name, prefix and share levels. It will help to generate the keys quickly for files that are shared via Gulosh. Gulosh supports sharing files with public. However, the public can only access the decrypted files. The decrypted files are encrypted again before sharing with the public. If you are not using the public share and in case of strong encryption keys, the files would be compressed and encrypted. Gulosh applications can also be used on other operating systems such as Linux and Mac. Using Gulosh requires Java JRE, which can be downloaded from Sun ( When installation is done, the following screen would appear after clicking Start. Gulosh is compatible with Microsoft Windows 8. It can be used on desktop computers having Intel and AMD processors. It can be installed on Windows XP and later. Creating user accounts is needed in order to access the application. You can create up to 50 different accounts
