- The format of the result can be changed from

number to percentage or vice versa. - If the value is less than 1, the result will be displayed in scientific format. - The metric conversion table sheet also has the print format feature. It is so easy to print the metric conversion table sheet by the click of one button. - Set the range of the conversion table with different metrics, no matter if it is a parent metric or child metric. - You can set the metric as the main metric, or as the sub-metric. The sub-metric name will appear in the format like “Metric Main Metric -> Sub-metric”. - You can directly copy the spreadsheet of the converted metric value. - No data entry to keep the data consistent. - Printable metric conversion table sheet template will save a lot of your time. The exhaust gas of diesel engines consists of unburnt fuel and a considerable amount of smoke. The burning of the unburnt fuel yields carbon monoxide (CO), hydrocarbons (HC), nitrogen oxide (NO_x), and particulate matter (PM). Thus, the production of emissions is a principal aim of

emission control systems. Emission control systems of diesel engines include both open-loop and closed-loop fuel injection systems. In an open-loop fuel injection system, the amount of fuel delivered to the engine is a function of the engine speed and load. To control the amount of fuel delivered in a closed-loop fuel injection system, the air and fuel mixture in the combustion chamber is sensed to determine the amount of fuel required to achieve complete combustion of the air and fuel mixture. The amount of fuel required to achieve complete combustion is supplied by the closed-loop fuel injection system to achieve the desired engine performance. The basic components of a closed-loop fuel injection system include a fuel metering unit and a fuel control unit. In the fuel metering unit, the amount of fuel delivered to the engine is a function of the load and the speed of the engine. The fuel metering unit regulates the flow of fuel to the combustion chamber and provides a steady

metering flow of fuel to the combustion

System Requirements:

OS: Windows 7, Windows 8/8.1 Processor: 2 GHz Intel Core 2 Duo or equivalent Memory: 2 GB RAM Graphics: DirectX 9.0c compatible video card with 1 GB VRAM DirectX: Version 9.0c Storage: 250 MB available space Additional Notes: You must have installed and be running the game Client version prior to this patch.
